1 Product description

This User Manual describes Vacuum Circuit Breakers manufactured by Tavrida Electric.

Tavrida Electric MD circuit breakers are designed for rated voltage up to 15 kV.

Vacuum Circuit Breakers described in the current document can be used in a variety of switchgear and are intended to perform switching operations in network rated and faulty modes.

The breakers are comprised of following main components:

- Indoor Switching Module (ISM) The ISM incorporates Tavrida Electric vacuum interrupters with monostable magnetic actuators and solid dielectric insulating materials. No SF-6 or oil insulation is used in the ISM;
- Control Module (CM) The CM is a microprocessor based controller that provides ISM operation, protection and data logging functions;
- Kits The kits of components are used to provide circuit breaker application properties.

This manual contains information on switching operations, required check-ups and maintenance, as well as service and disposal procedures. The purpose of the document is to provide necessary product information for users providing installation, commissioning and utilizing installed equipment.

1.1 Abbreviations

- AC Actuator coil
- AS Auxiliary switch
- **BIL Basic Insulation Level**
- **EMC** Electromagnetic compatibility
 - **CM** Control Module
 - CO Close Open operations cycle
- Com Common point of contact
 - I/O Input / Output
- ISM Indoor Switching Module
- LED Light emitting diode
- (P)MCB Protective miniature circuit breaker
 - **PS** Position switch
 - **NA** Not applicable
 - **NC** Normally closed contact
 - **NO** Normally open contact
 - PCD Phase center distance
 - **USB** Universal Serial Bus
 - VCB Vacuum Circuit Breaker
 - VI Vacuum interrupter

1.2 Main technical parameters

Main technical data and circuit breaker technical parameters are presented in the tables below.

Table 1 - Main technical parameters

Туре	ISM15_MD1	ISM15_MD3
Rated voltage (Ur)	15 kV	15 kV
Rated normal current (Ir)	1250 A	1250 A
Rated power frequency withstand voltage (Ud)	36 kV	36 kV
Rated lightning impulse withstand voltage (peak) (Up)	95 kV ¹⁾	95 kV ¹⁾
Rated short-circuit breaking current (Isc)	31.5 kA ²⁾	31.5 kA ²⁾
Rated peak withstand current (Ip)	82 kA	82 kA
Rated short-time withstand current (Ik)	31.5 kA	31.5 kA
Rated duration of short circuit (tk)	4 s	4 s
Rated frequency (fr)	50/60 Hz	50/60 Hz
Mechanical life (CO-cycles)	30 000	50 000
Maximum number of CO-cycles per hour	60	60
Operating cycles, rated-short circuit breaking current	50	50
Closing time	≤ 20 ms	≤ 25 ms
Opening time	≤ 8 ms	≤ 35 ms
Rated operating sequence at rated normal current	O-0.3s-CO-	10s-CO-10s-CO ³⁾
Rated operating sequence at rated short-circuit breaking current	O-0.3s-	-CO-15s-CO
Auxiliary circuits insulation strength ⁴⁾		
Power frequency test voltage (1 min) according to IEEE C37.09	2.5kV	2.5kV
Insulation resistance, 1000V DC according to IEC60255-27	≥ 5 MOhm	≥ 5 MOhm
Standards	IEEE C37.09, C37	7.09a, C37.09b, C37.04
Mechanical vibration withstand capability according to IEC 60721-3-4	Class 4M4	Class 4M4
Resistance of main circuit	≤ 17 µOhm	≤ 17 µOhm
Weight (depending on Phase center distance)	33-35 kg	13 kg
Altitude above sea level	1000 m ⁵⁾	1000 m ⁵⁾
Relative humidity in 24 hours	≤ 95 %	≤ 95 %
Relative humidity over 1 month	≤ 90 %	≤ 90 %
Temperature Range	-45°C+55°C	-45°C+55°C
Degree of protection according to IEC 60529 of actuator compartment		IP40

Туре	ISM15_MD1	ISM15_MD3	
Service conditions	 a) The ambient air is not polluted by dust, smoke, corrosive and/or flammable gases, vapor or salt and would be considered as having a site pollution severity class (SPS) "very light" according to IEEE C37.04 Table C.1. b) The average value of the water vapor pressure, over a period of 24 h, does not exceed 2.2 kPa. c) The average value of the water vapor pressure, over a period of one month, does not exceed 1.8 kPa. 		
Type of driving mechanism	Monostable	magnetic actuator	
Operation counter	Electrical, built	in into control module	
Design, switching capacity of silver auxiliary contacts			
Number of available auxiliary contacts for three-phase ISM	Up to 6 NO + 6 NC	2 NO + 2 NC	
Minimum current for 12 V AC / DC, ohmic load	1	00 mA	
Minimum current for 12 V AC / DC, inductive load (t=20 ms, cosj =0,3)	1	00 mA	
Maximum current for 30 V DC, ohmic load		10 A ⁶⁾	
Maximum current for 30 V DC, inductive load (t=20 ms)		3 A	
Maximum current for 60 V DC, ohmic load		0.9 A	
Maximum current for 60 V DC, inductive load (t=20 ms)		0.9 A	
Maximum current for 125 V DC, ohmic load	0.5 A		
Maximum current for 125 V DC, inductive load (t=20 ms)	0.03 A		
Maximum current for 250 V DC, ohmic load	0.25 A		
Maximum current for 250 V DC, inductive load (t=20 ms)	0.03 A		
Maximum current for 125 V AC, ohmic load		10 A ⁷⁾	
Maximum current for 125 V AC, inductive load (cosj =0,3)		5 A	
Maximum current for 250 V AC, ohmic load		10 A ⁷)	
Maximum current for 250 V AC, inductive load (cosj =0,3)		5 A	
Design, switching capacity of gold-plated auxiliary contacts ⁶⁾			
Number of available auxiliary contacts for three-phase ISM	Or	n request	
Minimum current for 5 V AC / DC		1 mA	
Maximum current for 10 V AC / DC	300 mA		
Maximum current for 30 V AC / DC	100 mA		
Maximum voltage AC / DC	30 V		
CM operation times			
Preparation time for the operation of the CM after switching on the auxiliary power supply	tion time for the operation of the CM after switching on the auxiliary power supply ≤ 15 s		
Preparation time for the close operation of the CM after a previous close operation		≤ 10 s	
Preparation time for the trip operation of the CM after switching on the auxiliary power supply	≤ 0.1 s		
Trip capability after failure of the auxiliary power supply	2	: 60 s ⁸⁾	

1) Small dimensions of switching module may not provide necessary phase-to-ground clearance for every particular busbar connection. It is recommended to check BIL level of particular busbar connection in closed breaker position. Alternatively, a set of predesigned rubber insulation sleeves (cbkit_ins_4) may be used, which are preliminarily tested to provide the required BIL.

 At 40% d.c. component.
 The number of sequential Close-Trip operations with a 10 second interval should not exceed 10. The number of Close-Trip operations should not exceed 60 per hour. Sequence of 10s Close-Trip operations can be repeated only after 260 s pause.

4) Isolation resistance check is not applicable for "Actuator Coil" circuits of CM.

5) Up to an installation altitude of 1000 m above sea level. Above 1000m, the external insulation measurement of the ISM must be increased by the atmospheric correction factor Ka according to IEEE Std C37.100.1compared to the insulation measurement at sea level. The maximum allowed altitude is 2000 m above sea level.

6) Gold-plated auxiliary contacts are available on request. Contact your nearest sales representatives.

7) At 5 min short-term duty. Continuous current - 5 Å.

8) In case of Dry contacts "Close" and "Trip" are open.

Parameter	Value
CM operation time	
Preparation time for the operation of the CM after switching on the auxiliary power supply	≤ 15 s
Preparation time for the close operation of the CM after a previous close operation	≤ 10 s
Preparation time for the trip operation of the CM after switching on the auxiliary power supply	≤ 0.1 s
Trip capability after failure of the auxiliary power supply	≥ 60 s ¹⁾
CM supply voltage	9
Rated range of supply voltage of CM 16 1(60 2)	24V to 60V DC
Rated range of supply voltage of CM 16 1(220 2)	110V to 220V AC/DC
Rated range of supply voltage of CM_16_2(220_2)	50/60Hz for AC
Operating range (80-120%) of CM_16_1(60_2)	19V to 72V DC
Operating range (80-120%) of CM_16_1(220_2)	85V to 265V AC/DC
Operating range (80-120%) of CM_16_2(220_2)	50/60Hz for AC
Power consumption o	f CM
Charging the close and trip capacitors of CM_16_1(60_2)	≤ 25 W
Charging the close and trip capacitors of CM_16_1(220_2) Charging the close and trip capacitors of CM_16_1(220_2)	Z 3 W
Charging the close and trip capacitors of CM 16 2(220 2)	\leq 42 W AC ²⁾ \leq 37 W DC
Permanent power consumption (standby) of CM_16_1(60_2)	≤ 5 W
Permanent power consumption (standby) of CM_16_1(220_2)	23 W
Permanent power consumption (standby) of CM_16_2(220_2)	\leq 7 W AC ³ \leq 5 W DC
Inrush current of CM_16_1(60_2) with discharged capacitors	≤ 120 A
Inrush current of CM_16_1(220_2) with discharged capacitors	= 120 A
Inrush current of CM_16_2(220_2) with discharged capacitors	≤ 18 A
Inrush time constant of CM 16 1(60 2) with discharged capacitors	≤ 0.5 ms
Inrush time constant of CM_16_1(220_2) with discharged capacitors	- 0.0 110
Inrush time constant of CM_16_2(220_2) with discharged capacitors	≤ 4 ms
Design, Switching Capacity of CM Output	t Relavs (Drv Contacts)
Number of relays in CM 16 1	
Number of relays in CM_16_2	3
Number of available contacts for one relay	1 NO + 1 NC with common point
Rated voltage	240 V
Rated current AC	16 A
Maximum breaking power AC	4000 VA
Maximum switching current 250V DC	0.35 A
Maximum switching current 125V DC	0.45 A
Maximum switching current 48V DC	1.3 A
Maximum switching current 24V DC	12 A
Switching time	5 ms
Operations counter	10 digits, available via USB port
"Close" and "Trip" dry contacts	s inputs of CM
Output voltage	≥ 30 V
Contacts closed current	≥ 50 mA
Steady state current	≥ 5 mA
Weight of CM_16_1	1 kg
Weight of CM_16_2	1 109
Overall dimensions of CM ⁴⁾	190x165x45 mm
Temperature Range	-40°C+55°C
Service conditions	 a) The ambient air is not polluted by dust, smoke, corrosive and/or flammable gases, vapors or salt and would be considered as having a site pollution severity class (SPS) "very light" according to IEEE C37.04 Table C.1. b) The average value of the water vapor pressure, over a period of 24 h, does not exceed 2.2 kPa. c) The average value of the water vapor pressure, over a period of one month, does not exceed 1.8 kPa.

Parameter	Value				
CT Power Supply Parameters (for CM_16_2(220_2) only)					
Operating current range	2-300 A				
Power consumption per phase during charging trip capacitors					
- 2 A	5 VA				
- 5 A	12 VA				
- 10 A	25 VA				
- 30 A	120 VA				
- 300 A	8 kVA				
Preparation time for trip operation (charging of the trip capacitor), no more than					
- 2 A	1000 ms				
- 5 A	400 ms				
- 10 A	150 ms				
- 30 A	110 ms				
- 300 A	100 ms				
Current carrying capacity, not less than					
- 2 A	8				
- 5 A	100 s				
- 10 A	10 s				
- 30 A	1 s				
- 300 A	0.1 s				
Environmental Conditions: Locati	on, ordinary dry				
Maximum operating temperature	55°C				
Maximum operating altitude	2000 m				
Maximum humidity, no more	98 % (no condensation)				

1) 2) 3) 4)

In case of Dry contacts "Close" and "Trip" are open. At Cos j >0.66. At Cos j >0.33. Overall dimensions of ISM are given in "Appendix 3. Overall drawings"

1.3 Disclaimers

Tavrida Electric will not accept any claims for damages caused by improper transport, storage or unpacking. Transport damage must be reported in writing to the supplier as soon as it is discovered.

The Technical manual contains information necessary for installation, commissioning and operation. It is absolutely necessary to read the Technical manual carefully and to adhere to the instructions and relevant regulations. Tavrida Electric will not accept any claims for damages caused by improper usage of the Vacuum Circuit Breakers. In case of special configurations please contact Tavrida Electric prior of usage of the Vacuum Circuit Breakers.

1.4 Precautions

- Check whether the installation position (distances, spatial separation, and the surroundings) is suitable for the switching devices.
- Installation, operation and maintenance shall only be carried out by trained and experienced personnel who are familiar with the equipment and the electrical safety requirements.
- During installation, commissioning, operation and maintenance of the equipment the relevant legal regulations, accident prevention regulations and the connecting conditions of the electric utilities shall be followed.
- Take note that during operation of the Vacuum Circuit Breakers certain parts are subject to dangerous voltage. Mechanical parts, also remote-controlled, can move quickly. Failure to comply may result in death, severe personal injury or damage to equipment.
- Pay attention to the hazard statements located throughout this Technical manual.
- The operating conditions of the vacuum circuit breakers shall comply with the technical data specified in this Technical manual.
- Personnel installing, operating and maintaining the equipment shall be familiar with this Technical manual and its contents.

1.5 Warranty

Unless otherwise stated in the contract, the warranty period is stated in Standard warranty policy. If agreed to otherwise, the contract conditions apply. No warranty is given in the case of ...

- a) ... the warranty period having run out during the period of storage with the customer;
- b) ... the operating conditions, ambient conditions, transport and storage conditions have not been adhered to according to the application description or the Installation and Operating Instructions;
- c) ... an unauthorized manipulation of the device has been carried out, such as opening the housing or

damaging the seal;

d) ... the device has not been properly installed, such as incorrect connection of supply voltage of auxiliary circuits.

2 Nameplates and seals

The Vacuum Circuit Breakers itself does not have nameplates or seals but main components (ISM, CM and manual generators) do.

ISM nameplates and seals

Each ISM has the following plate and labels:

- Label
- Serial number plate
- Seals

	TYPE: ISM15_MD_1(150)		
Rated maximum voltage	15 kV	Rated cont. current	1250 A
Rated impulse voltage	95 kV	Rated S-C current	31.5 kA1
Rated dielectric withstand	42 kV	DC component	40%
Power frequency	60 Hz	Short time current	31.5 kA / 4 s
Peak cap.bank energizing current	3000 A ²	Interrupting time	See user manual
Cable charging brk. current	31.5 A	Pole centre distance	150 mm
Year manufactured	2024	Weight	33 kg

3 Product handling

18 TAVRIDA ELECTRIC

3.1 Transportation

The ISMs are transported in the original packing only. Any kind of transport and combinations thereof are applicable. Transportation shall be provided in waterproof compartments. If air transport is used all products shall be transported inside heated, pressurized compartments. The packed goods shall be handled in accordance with the handling symbols. Loading procedures for ISM packaging shall be carried out only with use of fork lifts, hoists or cranes. If possible the packaged ISM shall be placed on a pallet. During transportation the ISM must not be subjected to sharp impacts or dropped.

3.2 Storage

If immediate installation is not possible, the ISM shall be stored in the original packing under the following conditions:

- the ISM is switched off (main contacts in the open position);
- desiccant must be placed in the packaging;
- storage must be dry, well ventilated and the room temperature should be between 40°C and + 55°C.

Average humidity measured over 1 year period shall not exceed 75% at 50°C. If several ISMs are stacked a maximum of two vertical layers are permitted

In case the storage term exceeds one year from the production date it is recommended to perform the procedure of CM's electrolytic capacitor conditioning:

- apply power to the CM for 20 seconds;
- switch off the power supply and wait for 60 seconds;
- repeat the above actions 2 times;
- apply power to the CM continuously for 8 hours.

This procedure shall be performed annually during storage of the CM.

3.3 Unpacking and inspection

ISM unpacking and check

Before unpacking, check the carton for damage. Removal of the products from the original packaging must be carried out with care and in accordance with lifting procedures. Every ISM and CM component is supplied with the routine test certificate. Unloading procedures for ISM shall be carried out only with use of hoists or cranes. Lifting gear must not be attached to the support insulators. To lift the breaker, attach M12 ringbolts to the upper terminals (B or A and C) of the MD breaker and lift the breaker by the attached ringbolts.

All items should be checked visually for:

- mechanical damage, scratches, discoloration, corrosion;
- damage to the seals Figure 3.

Any transport damage must be reported immediately to the carrier in writing. Damages shall be photographically documented.

3.4 ISM and CM packaging and scope of supply

ISM packaging and scope of supply

The ISMs are placed in cardboard boxes (Figure 13):

- handling symbols label for transport and storage of the delivery unit (Figure 11);
- labels for manufacturers and product information (Figure 14);
- label for logistics data (Figure 12).

The ISM and CM scope of supply is presented in Appendix 1.

Label 3 for manufacturers' and product information

The ISM shall have undamaged warranty seals (appearance of seal is shown in Figure 3, its placement on the ISM (there are two warranty seals on each side of the ISM metal frame) - in Figure 4). The ISM designation and serial number shall comply with data in the ISM routine test certificate (appearance of serial number plate is shown in Figure 2, its placement on ISM - in Figure 4).

Each of ISM15_MD_1, ISM15_MD_3 is supplied with the following components:

a) ISM

b) screwdriver Unit_Screwdriver_1 c) at

auxiliary switches board

Figure 15 ISM15_MD_1 scope of supply

TNA_ISM15_MD_1 is supplied with 2 x CBkit_ASboard_2(3S). This includes 6 x NO (52a) and 6 x NC (52b) auxiliary contacts (3NO+3NC on each board). Other options are available on request – see Table 3.

b) screwdriver Unit_Screwdriver_1

CM_16_1 packaging and scope of supply

CM is packed and delivered in cardboard boxes. The CM cardboard box can be delivered separately from the ISM or be included in the ISM package.

Figure 18

CM packaging labels

The CM_16_1 shall have undamaged warranty seals (its placement on the CM is shown in Figure 8). The CM settings code and serial number shall comply with data in the CM routine test certificate (appearance of the CM_16_1 serial number label and settings code label are shown in Figure 5 and Figure 6, their placement on the CM_16_1 – in Figure 8).

Each CM is supplied with the following components:

3.5 Optional kits scope of supply

CBkit_Ins_4 scope of supply

CBkit_Ins_4 provides the dielectric strength of busbars connection to the ISM15_MD_1 and ISM15_MD_3. The kit has components for one pole, so three such kits are necessary for one ISM15_MD_1 insulation and one – for ISM15_MD_3. The kit is delivered separately and packed in a plastic bag.

The kit includes one variant of the following options depending on the parameter value:

Rubber insulator CBdet_RubberIns_2 (for bars 40x10 mm) - 2 pcs.

Figure 20 CBkit_Ins_4(1) scope of supply Rubber insulator CBdet_RubberIns_3 (for bars 80x10 mm) - 2 pcs.

Figure 21 CBkit_Ins_4(2) scope of supply CBkit_Interlock_3 can be used with ISM15_MD_1, ISM15_MD_3 as an accessory for manual trip / lockout of the ISM by key switch. The kit is packed in a cardboard box.

Figure 22 CBkit_Interlock_3 packing

Figure 23

CBkit_Interlock_3 package labeling

The kit includes:

- 1. Screw
- StandDet Screw DIN912(M10 20 Fe88-Zn) 2. Cable tie
- StandDet_CableTie_LS(4.6_150_40)
- Stopper CBdet_Stopper_2 3.
- Interlock unit CBunit_Interlock_1(1) 4.
- 5. Nut StandDet Nut DIN555(M5 Fe-Zn) Washer StandDet_Washer_DIN127-A 6.
- (5_Fe-Zn) 7. Washer StandDet_Washer_DIN125-1A
- (5.3_Fe-Zn)

The kit includes:

- 1. Label CBdet_Label_10(EN)
- 2.
- Interlock unit CBunit_Interlock_12(1) Cable tie StandDet_CableTie_LS(4.6_150_40) 3.
- 4. Handle CBunit_Handle_1

Washer CBdet_Washer_7 5.

- Stopper CBdet_Stopper_28 6.
- Screw StandDet_Screw_DIN7985-Ph 7. (M6_40_Fe48-Zn)
- Nut StandDet Nut DIN985(M6 Fe8-Zn) 8.
- Washer StandDet_Washer_DIN6799(7_Fe-Zn) 9.

Figure 27 CBkit_Interlock_4 scope of supply CBkit_Interlock_5 can be used with the ISM15_MD_1, ISM15_MD_3 as an accessory for manual trip of the ISM as a manual trip button. The kit is packed in a cardboard box.

Figure 28 CBkit_Interlock_5 packing

Figure 30 CBkit_Interlock_5 scope of supply

CBkit_PosInd_1 packaging and scope of supply

CBkit_PosInd_1 is used to indicate the ISM main circuit position. The position indicator is packed in a plastic bag.

Figure 31 CBkit_PosInd_1 scope of supply

CBcomp_RelCable_3 packaging and scope of supply

CBcomp_RelCable_3 is a flexible trip and lock cable used for connection of ISM manual trip or interlock connection to the ISM. The cable is packed in a plastic bag.

Figure 32 CBcomp_RelCable_1 scope of supply

CBunit_ManGen_1 and CBunit_ManGen_2 packaging and scope of supply

CBunit_ManGen is used to charge the CM in cases where the main auxiliary power supply is not available. It is packed in a cardboard box.

Figure 33

CBunit_ ManGen_1 and CBunit_ ManGen_2 packing

Figure 35 CBunit_ ManGen_1 and CBunit_ ManGen_2 scope of supply

3.6 Handling

To avoid equipment damage follow the handling recommendations listed below:

- 1. handling in accordance with pictorial symbols;
- 2. elimination of drops from any heights;
- 3. elimination of any mechanical impacts which can cause damage of the package;
- 4. the boxes are to be stowed to ensure complete tightness. The boxes should be hitched and lashed tightly so that it could not shift inside of a container under any conditions of carriage;
- 5. the modules shall be tied up with 16 mm polyester band twice. Top edges of the boxes shall be protected with plastic corners. The boxes can be additionally wrapped with stretch film.

4 Installation

4.1 Primary part

4.1.1 Preparation

All applicable regulations must be adhered to during installation, commissioning and operation, including ANSI, IEEE, CEC, NEC, and other local, national or international standards / codes as required. Work shall only be performed by qualified personnel.

Wearing of gloves for handling the parts during installation is recommended. Insulating material surfaces must be cleaned with clean and dry rags. The contact surfaces of connections must be cleaned before installation. If the contacts have become oxidized during transport or storage, then the following actions must be followed:

- Clean contact surfaces with a rough, dry cloth;
- In case of hard oxidation, clean with a hard plastic sponge, the coating layer must not be removed;

The nuts, washers and conical spring washers shall be used for connecting the terminals of the ISM with the busbars.

If additional fastening material is required, steel bolts according to EN ISO 898 class 8.8 (yield point 800 N/mm²), nuts according to EN ISO 890 class 8 (yield point 880 N/mm²), washers to DIN 125, and high load conical spring washers (#431540 in Schnorr catalogue - for ISM15_MD) shall be used. ISM mounting and shall be made with a calibrated torque wrench only.

4.1.2 Installation of the ISM

Mounting

In any switchgear application ISM15_MD can be installed in any position (Horizontal or Vertical).

Figure 36 Withdrawable unit with ISM15_MD_1, tilted arrangement

Busbars and cables shall be connected with the ISM primary terminals mechanically in a stress-free manner. No pressure, tension or torsion forces shall act on the ISM. To avoid high mechanical loads on the ISM, the busbar connections shall be supported by additional insulators.

Calibrated torque wrenches shall be used for mounting of switching modules and the connection of busbars. Points shown below should be used for mounting the ISM.

1. Eight threads on both sides of the frame for obligatory ISM fixing (M10, torque is 25±3 Nm).

Figure 37 ISM15_MD_1 mounting points

Ensure that the frame to which the ISM will be fixed does not create static load to the switching module.

4.1.3 Main terminal connections of ISM15_MD_1, ISM15_MD_3

Primary terminals connection

To comply with the rated impulse withstand voltage according to IEEE C37.09 one of the insulation kits for ISM15_MD_1 or ISM15_MD_3 may require (see table 4 below):

Table 4 - Insulation of ISM15_MD_1 main terminals

PCD, mm	BIL, kV	Busbars	Insulation kit
150	75 95	40x10 mm	Not required CBkit_Ins_4(1)
210	75	40x10 mm 80x10 mm	Not required
210	95	40x10 mm 80x10 mm	CBkit_Ins_4(1) CBkit_Ins_4(2)

Note: Selection of single or double bars 40x10 mm depends on the rated normal current of ISM application.

Figure 38

Edges of bars 40x10 mm at the place to ISM terminal connection

Figure 39 Edges of bars 80x10 mm at the place to ISM terminal connection

M12 bolts fixing busbars (or contact arms) to ISM15_MD_1 or ISM15_MD_3 terminals should be tightened with a torque of 50±2 Nm.

If insulation kit is not used compliance with the rated insulation level shall be verified by a voltage test.

To prevent static load on the ISM poles it is not allowed to fasten busbars to the ISM terminal if there is a gap of more than one millimeter between the busbar and the ISM terminal just before this fastening. Bars shall be accurately prepared to avoid bending and (or) twisting forces to terminals when these bars are fastened.

Details of ISM15_MD terminals connection to rectangular cross-shaped busbars (at fixed installation, for example)

Figure 41

Details of ISM15_MD terminals connection to rectangular cross-shaped busbars with help of CBkit_Ins_4(1) (at fixed installation, for example)

Figure 42

Details of ISM15_MD terminals connection to rectangular cross-shaped busbars with help of CBkit_Ins_4(2) (at fixed installation, for example)

Electrodynamic forces clearances

To avoid unacceptable high electrodynamic impact on the ISM, additional support insulators are required if the unsupported busbars are longer than specified in the Table 5.

Figure 43 ISM support insulators installation distance

	Short-circuit current		
ISM	20 kA	25 kA	31.5 kA
	L, mm		
ISM15_MD_1 with 150 mm PCD	700	450	300
ISM15_MD_1 with 210 mm PCD	980	630	420
ISM15_MD_3 ¹⁾	930	600	400
ISM15_MD_3 ²⁾	1100	820	500

Table 5 - Additional support insulators installation minimum distances

¹⁾ In case ISM15_MD_3 is installed close to the other ISM15_MD_3.

²⁾ In case ISM15_MD_3 is installed separately from other ISM15_MD_3.

Electromagnetic clearances

To avoid primary current effect on ISM actuator, the minimum clearance between busbars and the ISM frame (Figure 44) should be no less than stated in the Table 6.

Figure 44 Electromagnetic clearances

Table 6 - Electromagnetic clearances

Short circuit current	Minimum clearance (L)	Applicable for
≤20 kA	100 mm	ISM15_MD_1
≤20 KA	100 mm	ISM15_MD_3
25 kA	120 mm	ISM15_MD_1
23 KA	120 mm	ISM15_MD_3
21 5 44	150 mm	ISM15_MD_1
31.5 kA	150 mm	ISM15_MD_3

Insulation clearances

The recommended minimum phase-to-phase and phase-to-ground air clearances are stated in Table 7. Shorter distances shall be verified by a voltage test.

Table 7 - Insulation clearances

Power frequency rated voltage	Impulse test voltage (BIL)	Minimum clearance (L2)
5kV	60kV	120mm
15 kV	95 kV	140 mm

Figure 45 ISM15_MD insulation clearances - 60 kV BIL, 5 kV rated voltage application

Figure 46 ISM15_MD insulation clearances - 95 kV BIL, 15 kV rated voltage application

Coordination of minimum clearances

Based on electromagnetic influence and rated insulation voltage, the largest value clearance should be selected.

4.1.4 ISM15_ MD_1, MD_3 interlocks

Interlocking mechanism

Each of ISM15_ MD_1, MD_3, is equipped with an interlocking shaft that can be rotated clockwise to the "unlatched" position or counter-clockwise to the "open and locked" position. In the "unlatched" position the ISM can perform "close" and "open" operations.

In the "open and locked" position the ISM the interlocking shaft prevents the actuator mechanically from closing. In addition the actuator coils are disconnected from the CM.

If the ISM is closed, rotation of the interlocking shaft from "unlatched" to "open and locked" position leads to manual tripping. The CM indicates alarm "Manual Trip".

The interlocking shafts of ISM15_ MD_1, MD_3 are not fixed in the "open and locked" position since these ISMs have a shaft return spring that returns them back to the "unlatched" position. To leave the shafts in the "open and locked" position the external force shall be applied to the shaft to hold it in this position as shown in Figure 48.

Figure 47 ISM15_MD_1 interlocking shaft

Open, locked

Interlocking shaft positions

Figure 48

Unlocked

Mechanical interlocking of ISM15_MD_1, ISM15_MD_3 can be performed by the remote interlocking unit. It connects with switching module via release cable. Follow the instructions below to install it:

- 1. Unscrew two captive screws 1;
- 2. Take off the plastic cover 2;
- 3. Install release cable 3 in cam 4 as show below;
- 4. Put the plastic cover back and tighten two screws 1.

Figure 49

Figure 50

Interlocking shaft of ISM15_ MD_1, MD_3 operation by release cable

The release cable operating stroke is 37±0,5 mm, which is equal 90 degrees rotation angle of cam as shown in the Figure 48. Minimal bend radius for cable is 100 mm.

There is a possibility to install two remote interlocks which can operate independently of each other. For ISM15_MD_1, ISM15_MD_3 interlocking shaft torque is as follows:

Figure 51

ISM15_MD interlocking shaft torque

The interlocking process might be divided into next steps:

- "a-b" backlash;
- "b-c" blocker contacts the magnetic actuator plate;
- "c-d" blocker interacts the magnetic actuator plate;
- "d-e" switching module turns off;
- "e-f" switching module turns to "open and locked" position (point "f");

- "f-a" turning switching module to "unlatched" position (point "a").
- "g-h" -- electrical interlock action.

The allowed deviations are indicated by hatching.

Torque on the interlocking shaft for ISM manual trip

The torque on the interlocking shaft for ISM manual trip shall be no more than 3.5 N*m for ISM15_MD_1 and ISM15_MD_3;

Load capacity of ISM15_MD_1, ISM15_MD_3 interlocking shaft

The angle of the interlocking shaft rotation shall not exceed 90 °.

Exceeding any of the above limitations can lead to damage of the interlocking mechanism.

Connection of CBkit_Interlock_3 to ISM15_MD_1, ISM15_MD_3 interlocking shaft

CBkit_Interlock_3 can be used with the ISM15_MD_1, ISM15_MD_3 as an accessory for manual trip / lockout of the ISM by key switch.

The connection of the CBkit_Interlock_3 to the ISM15_MD_1, ISM15_MD_3 interlocking shaft is shown below. (Figure 52 – Figure 53). The ISM shall be in Unlatched position.

Notes:

- the bending radius of the flexible release cable shall be not less than 100 mm;
- it is recommended to install ISM in the Switchgear and connect its auxiliary circuits prior interlock connection to simplify the connection and adjustment process;
- if the flexible release cable passes through the Switchgear segregations according to the design solution it is recommended to pass it through these segregations prior interlock connection.

- 1. Unscrew two captive screws 1;
- 2. Take off the plastic cover 2;
- 3. Install release cable 3 in cam 4;
- 4. Put the plastic cover back and tighten two screws 1.

Figure 52 Connection of release cable to the ISM interlocking shaft

Figure 53 Connection of CBkit_Interlock_3 to the ISM interlocking shaft

Installation and adjustment of CBkit_Interlock_3 in the Switchgear is shown in the Figure 54– Figure 60.

Install CBdet_Stopper_2 on the CBunit_Interlock_1(1) with help of StandDet_Screw_DIN912(M10_20_Fe88-Zn) from the delivery kit of CBkit_Interlock_3. The orientation of CBdet_Stopper_2 depends on the way of next installation of CBunit_Interlock_1(1).

During fixation of

StandDet_Screw_DIN912(M10_20_Fe88-Zn) the rod of CBunit_Interlock_1(1) shall not be loaded by torque, the wrench shall be used for rod unloading.

Figure 54 Installation of CBdet_Stopper_2 on the CBunit_Interlock_1(1)

The state of the disconnector - unlocked, the state of the ISM - locked.

Figure 57 Installation of CBunit_Interlock_1(1) for variant with two disconnectors

42 AVRIDA ELECTRIC

Figure 59 Fixation of CBunit_Interlock_1(1)

CBunit_Interlock_1(1) shall be fixed with help of:

- StandDet_Screw_DIN7985-Ph(M5_25_Fe48-Zn);
- StandDet_Washer_DIN125-1A(5.3_Fe-Zn);
- StandDet_Washer_DIN127-A(5_Fe-Zn);
- StandDet_Nut_DIN555(M5_Fe-Zn)

from the delivery kit of CBkit_Interlock_3. Alternatively StandDet_Screw_DIN7504-K(4.8_19_Fe-Zn) from the delivery kit of CBkit_Interlock_3 can be used.

The flexible release cable shall be fixed in the Switchgear with help of StandDet_CableTie_LS(4.6_150_40) from the delivery kit of CBkit_Interlock_3. If necessary, the stroke of flexible release cable can be adjusted as shown in the Figure 60.

Figure 60 Adjustment of stroke of flexible release cable

Figure 61 Position of interlocking shaft of the ISM with connected CBkit_Interlock_3

Connection of CBkit_Interlock_4 to ISM15_ MD_1, ISM15_MD_3 interlocking shaft

CBkit_Interlock_4 can be used with the ISM15_MD_1, ISM15_MD_3 as an accessory for manual trip / lockout of the ISM by rotary switch.

The connection of the CBkit_Interlock_4 to the ISM15_MD_1, ISM15_MD_3 interlocking shaft is shown in the Figure 52 and Figure 62. The ISM shall be in unlatched position.

Notes:

- the bending radius of the flexible release cable shall be not less than 100 mm;
- it is recommended to install ISM in the Switchgear and connect its auxiliary circuits prior interlock connection to simplify the connection and adjustment process;
- if the flexible release cable passes through the Switchgear segregations according to the design solution it is recommended to pass it through these segregations prior interlock connection.

Figure 62 Connection of CBkit_Interlock_4 to the ISM interlocking shaft

Figure 63 CBkit_Interlock_4 mounting on the Switchgear door

Adjustment of CBkit_Interlock_3 in the Switchgear is shown in the Figure 60.

Connection of CBkit_Interlock_5 to ISM15_ MD_1, MD_3 interlocking shaft

CBkit_Interlock_5 can be used with the ISM15_MD_1, ISM15_MD_3 as an accessory for manual trip of the ISM as a manual trip button.

The connection of the CBkit_Interlock_5 to the ISM15_MD_1, ISM15_MD_3 interlocking shaft is shown in the Figure 60 and Figure 64. The ISM shall be in unlatched position.

Notes:

- the bending radius of the flexible release cable shall be not less than 100 mm;
- it is recommended to install ISM in the Switchgear and connect its auxiliary circuits prior interlock connection to simplify the connection and adjustment process;
- if the flexible release cable passes through the Switchgear segregations according to the design solution it is recommended to pass it through these segregations prior interlock connection.

Figure 64

Unscrew the self-tapping screws of the transparent cover and remove it.

4.1.5 Installation of ISM15_MD_1, ISM15_MD_3 main contacts position indicator

The installation of the main contacts position indicator is shown below. (Figure 65 - Figure 67). The ISM shall be in the Closed position.

Notes:

• the bending radius of the flexible indication cable shall be not less than 40 mm.

Figure 65 Connection of CBkit_PosInd_1 to the ISM

Figure 66

Drop the boss of the wire horizontally into the slot. Insert the end of the sheath into the V-shape spring contact.

Figure 67 Return the cover and fasten it to the ISM.

Figure 68 Adjust the indicator for both closed and opened states of the switching module.

Figure 69 Position indicator shows that main contacts are open

Figure 70 Position indicator shows that main contacts are closed

Installation of insulation kit CBkit_Ins_4

CBkit_Ins_4 will be provided with the ISM15_MD_1 and ISM15_MD_3 as an accessory to comply with the rated impulse withstand voltage of 95 kV. The installation of the CBkit_Ins_4 is shown in the Figure 71 and Figure 72.

- a) put insulator CBdet_ RubberIns_2 on the busbar
- b) connect busbar to the ISM terminal

c) screw the bolt M12 with torque 50±2 H*m

Cutting line

 cover the ISM terminal tightly by put insulator CBdet_RubberIns_2

e) insulation of double bars 40x10 mm connection is the same, insulator CBdet_RubberIns_2 shall be cut to fit with double bars

Figure 71

Installation of CBkit_Ins_4(1) in case of busbars 40x10 mm usage

a) cover the bar by shrinkable tube in case it is required

b) put insulator CBdet_RubberIns_3 on the busbar

c) screw the bolt M12 with torque 50±2 H*m and cover the ISM terminal tightly by put insulator CBdet_RubberIns_3

Figure 72

Installation of CBkit_Ins_4(2) in case of busbars 80x10 mm usage

4.1.6 Protective ground

For personnel protection the metal housing of the ISM must be connected according to the applicable regulations, such as IEEE C37.09, NFPA 70 via the marked earth screw of the ISM to the ground arrangement of the particular panel. The ground connection can be carried out with a cable or a copper bar. The area around the ground screw shall be cleaned before providing the ground connection. After the occurrence of a short circuit, the proper condition of the protective ground must be checked.

Fault current (1 s)	Maximum temperature	Cross section of earth connection
16 kA	300 °C	55-95 mm² (2/0 AWG or larger)
20 kA	300 °C	70-120 mm² (3/0 AWG or larger)
25 kA	300 °C	95-140 mm² (4/0 AWG or larger)
31.5 kA	300 °C	120-190 mm² (240kcmil or larger)

Table 8 - Reference values for cross sections of earth connections (copper)

The method of ISM15_MD_1, grounding is shown in the Figure 74.

An example of one side copper bar ground is represented in Figure 72.

Figure 75 Example of grounding the ISM by copper busbar

4.2 Secondary part

4.2.1 Three-phase ISM secondary connections

ISM15_MD_1 have secondary connectors as shown below.

a) ISM actuator coil terminal

b) Auxiliary switches board EA_Asboard_28 (XT2, XT3)

Figure 76

Terminal arrangement of the ISM15_MD_1

Note: The ISM15_MD_1 is supplied with auxiliary switches boards.

XT1		XT2, XT3 (Auxiliary switches board EA_Asboard_28)	
Terminal No.	Connection	Terminal No.	Connection
1	Actuator coil (SC1)	1	NC auxiliary switch S 1(1)
2	Actuator coil (SC2)	2	NC auxiliary switch S 1(1)
		3	NC auxiliary switch S 2(1)
		4	NC auxiliary switch S 2(1)
		5	NC auxiliary switch S 3(1)
		6	NC auxiliary switch S 3(1)
		7	NO auxiliary switch S 4(1)
		8	NO auxiliary switch S 4(1)
		9	NO auxiliary switch S 5(1)
		10	NO auxiliary switch S 5(1)
		11	NO auxiliary switch S 6(1)
		12	NO auxiliary switch S 6(1)

Table 9 - ISM15_ MD_1 terminal arrangement

4.2.2 Single-phase ISM secondary connections

Single-phase ISM15_MD_3 has secondary connectors as shown below.

Figure 77

Terminal arrangement of the single-phase ISM15_MD 3

Table - Single-phase ISM15_MD_3 terminal arrangement

XT1		
Terminal No.	Connection	
1	Auxiliary switch AS1 (AS1.1)	
2	Auxiliary switch AS1 (AS1.2)	
3	Auxiliary switch AS2 (AS2.1)	
4	Auxiliary switch AS2 (AS2.2)	
5	Auxiliary switch AS3 (AS3.1)	
6	Auxiliary switch AS3 (AS3.2)	
7	Auxiliary switch AS4 (AS4.1)	
8	Auxiliary switch AS4 (AS4.2)	
9	Actuator coil (SC1)	
10	Actuator coil (SC2) with internal interlock	
11	Actuator coil (SC3) without interlock	

Note: Actuator coil input CS3 is intended for case when internal interlock is not required. For instance, when three single-phase ISM15_MD_3 are connected in parallel to one control module. In such case the interlock of one of these ISMs can be used. Please contact the nearest Tavrida Electric sales representative for cases when three single-phase ISM15_MD_3 are connected in parallel to one control module for more information.

4.2.3 CM secondary connections

CM_16_1 has secondary connectors as shown below.

Figure 78

Terminal arrangement of the CM_16_1

Table 10 - CM_16_1 terminal arrangement

X1		X3		
Terminal No.	Connection	Terminal No.	Connection	
1	Power supply input (+)	1	Actuator coil output	
2	Power supply input (-)	2	Actuator coil output

15	Trip input]		

CM relay functionality:

- Relay 1 "ISM main contact position" relay;
- Relay 2 "Ready" relay;
- Relay 3 "Malfunction of Loss of auxiliary supply" relay.

Normal contact position (when NO contacts are open, NC contacts are closed) are following:

- For relay "Ready" when breaker is not ready;
- For relay "ISM main contacts position" when breaker is open;
- For relay "Malfunction or Loss of auxiliary supply" when there is no malfunction detected.

Relay "ISM main contact position" keeps its state after CM power supply disconnection.

USB port of CM is not used under service conditions (only for CM programming during production).

CM_16_2 has secondary connectors as shown below.

Figure 79

Terminal arrangement of the CM_16_2

Table 11 - CM_16_2 terminal arrangement

	X1				X3

4.2.4 Installation of the CM

The installation of the CM_16_1 is carried out according to the panel design either on the draw out unit or in the low voltage compartment of the switchboard. It must be separated from the high voltage compartment.

Figure 80 Provisions for CM_16_1 installation The CM can operate in any mounting position. Care must be taken for access and visibility of the terminals, LEDs.

Installation to CM terminals

Wires are connected to the CM terminals by using a screwdriver (Figure 19). The terminals can accept solid and stranded wire within the range 0.5-2.5 mm (14 - 18 AWG). Use copper conductors only. All wires insulation must be rated 600V or better. The insulation stripping length shall be 6-10 mm. Insulated auxiliary circuits shall provide 2 kV power frequency dielectric strength.

4.2.5 Installation of secondary cables between ISM and CM

Before connecting the CM_16_1 to the ISM compliance between ISM type (shown on ISM serial number plate – Figure 2) and CM (applicability of CM for particular type of ISM are shown on CM designation label – Figure 4 and CM packing label - Figure 18) shall be confirmed.

Warning! If the CM label does not show the correct ISM type do not use the CM. It can lead to damage of the ISM. Contact your nearest Tavrida Electric partner for replacement.

Secondary cables between ISM and CM shall be installed according to the following instructions (Figure 82 -

Figure 83). To achieve best possible protection against electromagnetic influences. The earthing point 3 hall be as close as possible to the CM. Unshielded parts of wires shall be not longer than 10 cm. Connections between the end of cable shields and ISM earthing points shall be not longer than 5 cm. Cable insulation must be rated 300V or better. Only ring type cable lug or similar should be used for CM16 earthing point connection.

Figure 82

Secondary cables between ISM15_MD_1 and CM_16_1

Figure 83

Secondary cables between ISM15_MD_3 and CM_16_1

Even after the CM is disconnected from all the power supplies there still may be hazardous voltage on the CM connectors. Achievement of safe voltage level is indicated by the extinction of all LEDs on the CM front panel. This may take up to 15 minutes after the CM is deenergized.

Figure 84 Sample of earthed cable shielding on ISM side

4.2.6 Auxiliary supply

Connection of CM_16_1 to power supply is shown below.

Power supply inputs

Figure 85

CM_16 power supply connection

Type of ISM shall be selected according to CM data given in Table 1.

If the CM is connected to DC voltage, pay special attention to the correct polarity for CM_16_1(60_1).

If Manual generators CBunit_ManGen are used for charging the CM, DC voltage outputs shall be connected to power supply inputs of CM.

Arrangement of output wires of Manual generators CBunit_ManGen_1 and CBunit_ManGen_2:

- red color wire positive polarity output wire;
- black color wire negative polarity output wire;
- yellow-green color wire manual generator earthing wire.

4.2.7 CM indication

The CM has the following LED indication functionality:

- CM "Power" indication;
- CM "Ready" state indication;

CM "Malfunction" state indication.

The placement of LED indicators are shown in figures below. The LED indicators on CM_16_1 are visible from two directions.

- 1. "Power" LED indicator
- 2. "Malfunction" LED indicator
- 3. "Ready" LED indicator

Figure 86 CM_16_1 LED indicators

The self-diagnostic system inside the CM detects possible malfunctions and reports them via the Malfunction LED blink signals and Malfunction or Loss of auxiliary supply Relay state. The explanation of the LED blink codes is given in Table 12.

CM state	Indication		
	LED Power	LED Ready	LED Malfunction
Power supply voltage is absent more than 3 minutes	off	off	off
"Close" operation is preparing	continuous	off	off
CM_16_1 is ready and operable	continuous	continuous	off
Power supply voltage is absent for more than 1.5 seconds	off	continuous	1 blink
Excessive trip or close time	continuous	off	2 blinks
Actuator coil isolated	continuous	off	3 blinks
Short circuit of Actuator coil	continuous	off	4 blinks
Manual Trip and Lock	continuous	off	5 blinks
Out of temperature range	continuous	off	6 blinks
ISM state is open without command from the CM_16_1	continuous	off	7 blinks
Internal fault of the CM_16_1	continuous	off	continuous

Notes.

1. Number of blinks in series followed by 1.5 s intervals, continuous light or off state are shown for LED indicators.

2. Period of checking Actuator Coil state (short circuit / isolated) - 10 s.

Priority of the fault indication starting from the lowest one:

- 1. CM_16_1 is out of temperature range;
- 2. ISM state is open without command from the CM_16_1;
- 3. Excessive trip or close time;
- 4. Manual Trip and Lock;
- 5. Actuator coil isolated;
- 6. Short circuit of Actuator coil;
- 7. Power supply voltage is absent more than 1.5 seconds.

4.2.8 CM relay contacts operation

Relay contacts of CM_16_1 change their state as described below.

Table 13 - CM relay "Ready" contacts operation

CM state	Relay "Ready" contacts state		
CIM State	NC (terminals 7-8 by default)	NO (terminals 6-7 by default)	
CM is ready for close or open operation	Open	Closed	
CM is not ready for close or open operation	Closed	Open	

Table 14 - CM relay "ISM main contact position" contacts operation

	Relay "ISM main contact position" contacts state		
ISM state	NC (terminals 4-5 by default)	NO (terminals 3-4 by default)	
ISM is closed	Open	Closed	
ISM is open	Closed	Open	

CM performs the checkup of ISM main contacts position and updates the "ISM main contacts position" relay status in the following cases:

- In case Close command was applied from the CM. In this case the update is performed not later than in 150 ms after ISM main contacts closing;
- In case Trip command was applied from the CM. In this case the update is performed not later than in 70 ms after ISM main contacts opening;
- Periodically every 10 s in case no Close or Open command was applied from the CM.

In case application project requires to define main contacts position faster than the timing mentioned above it is recommended to use auxiliary switches installed at the ISM. Position indication of ISM provided by CM can be incorrect, in case CM is not operable due to absence of auxiliary supply.

CM state	Relay "Malfunction or Loss of auxiliary supply" contacts state		
CM state	NC	NO	
Power supply voltage is absent for more than 1.5 seconds (1 blink of LED Malfunction)	Open	Closed	
Excessive trip or close time (2 blinks of LED Malfunction)	Open	Closed	
Actuator coil isolated (3 blinks of LED Malfunction)	Open	Closed	
Short circuit of Actuator coil (4 blinks of LED Malfunction)	Open	Closed	
Manual Trip and Lock (5 blinks of LED Malfunction)	Closed	Open	
Out of temperature range (6 blinks of LED Malfunction)	Closed	Open	
ISM state is open without command from the CM (7 blinks of LED Malfunction)	Open	Closed	
Internal fault of CM (continuous light of LED Malfunction)	Open	Closed	

4.2.9 CM_16_1 Series Factory Programmable Options

The CM_16 series is a flexible control module option with an array of factory programmable settings for optimizing control of the ISM breakers. When ordering a CM_16, the model code along with the pre-programmed settings code should be submitted to Tavrida. Use the Table 16 for configuration of a settings code based on the following options guide:

Breaker Type

To optimize the closing and trip pulses to the ISM actuators, this option sets various features of the CM_16 output power algorithm. Each model type can be selected. Note that connection to an ISM other than the one selected will produce a malfunction signal.

Undervoltage Functions

The CM_16 series has an option for automatic trip of the ISM on loss of auxiliary supply. The CM_16 will issue a trip command when the auxiliary supply drops below its minimum threshold (6VDC for the CM_16_1(60_2) and 60VAC / VDC for the CM_16_1(220_2) or CM_16_2(220)).

When set to "ON", the undervoltage delay parameter becomes active. This can be set from 0 to 60 seconds delay before the CM issues a trip command after loss of auxiliary power.

Similary, the undervoltage reclosing function becomes active. If set to "2", the breaker will automatically close when auxiliary power is restored with a delay time as set by the undervoltage reclosing delay parameter.

Digital Outputs

The CM_16 series has x3 output relays for external signalling such as lamps or relay alarm inputs. Each output has five settings options. The output can be disabled; signal close / open position of the breaker primary contacts; signal a loss of auxiliary supply; signal ready for operation; or signal a malfunction.

Trip / Close Delays

The ISM breaker series have high speed actuators for trip and close operations. The CM_16 by default is set for a 12ms trip and close delay time for normal breaker operations. For arc flash mitigation, fast transfer, or other unique applications, this delay time can be adjusted for trip and close independantly from 4ms to 40ms in 1ms increments. Note that for delay times less than 12ms the fault interrupting rating of the ISM may need to be reduced; consult Tavrida Applications Engineering for information.

Trip / Close Inputs

The CM_16 series use dry contact trip and close inputs, using any normally open contact by default as the trigger. For some applications such as mining, a normally closed loop is required for the trip circuit whereby any break in the trip connection will cause the breaker to open. For this purpose the CM_16 close and trip inputs can be set independently for either NO or NC triggers.

Parameter	Options	Settings Code		
ON have	ISM15_MD_1	10		
SM type	ISM15_MD_3	17		
	_			
Brotaction actings: Trip by loss of auxiliary aupply	Disabled	0		
Protection settings: Trip by loss of auxiliary supply	Enabled	1		
Tripping time	S	0 - 60		
	—			
Autoroplasing upon auxiliant neuror restoration	Disabled	1

Method to send Open command	Open circuit	2			
Method to send Close command	Short circuit	1			
	Open circuit	2			

Example

For a control module programmed with SM type - $ISM15_MD_1 = 10$, protection by loss of auxiliary supply disabled = 0, tripping time set to = 0 seconds, autoreclosing upon auxiliary power restoration - disabled with = a 60 second reclose delay, output relay 1 - Driver ready = 4, output relay 2 - Malfunction = 5, output relay 3 - Main contact position = 2, open delay of = 12 ms, close delay of = 12 ms, the open command is sent by - short circuit = 1, and the close command is sent by - short circuit = 1:

Settings code = 10-00-160-452-1212-11

4.2.10 CM_16_1 Series Operations counter reading.

The CM_16 series control modules have breakers operations counter function built in. The counter is available for reading with Tavrida software.

Reset the initial amount of operations stored in the control module associated with connected circuit breaker prior to put it into service.

Use Tavrida software to access the value of counted operations when you need.

To get access to operations counter install the CM16 configuration tool. The operations counter can be found under the settings tab.

Commissioning

The list of commissioning operations and checks is shown in Table 17 below. Initial state of VCB components before checks: ISM - open, CM - deenergized. Main circuits of ISM shall be disconnected/isolated from the main circuits of substation to avoid high voltage being applied to the ISM before the commissioning procedure completion. Commissioning and maintenance is only permitted for qualified and trained personnel.

Operation description	Required tool	Approximate timing
	Tests at the end of installation	
Check for damage, remove any dirt, contamination or moisture	Visual check, no tool is required	2 minutes
Unsupported busbar length shall be according to Table 5 for ISM15_MD	Ruler, tape measure or calliper - depends on distance value and place of measurement execution	2 minutes
Fixing points shall be according to Figure 37	Visual check, no tool is required	1 minute
Bolts and torques shall be according to Figure 37	Torque wrench according to torque value	2 minutes
Clearances shall be according to subchapter 4.1.3	Ruler, tape measure or calliper - depends on distance value and place of measurement execution	2 minutes
Protective earthing shall be according to subchapter 4.1.6	Visual check, no tool is required	1 minute
Check that free air circulation at ISM is possible	Visual check, no tool is required	1 minute
Installation of CM shall be according to subchapter 4.2.4	Visual check, no tool is required	1 minute
Availability of the CM auxiliary power supply. It is recommended to use the same auxiliary power supply as for protection and control devices. Type of voltage and voltage level according to selected CM type	Voltmeter with measurement range according to expected power supply voltage value	2 minutes
Polarity of auxiliary power supply and selection of MCB shall be according to subchapter 4.2.6. Check of compliance between ISM type on ISM serial number plate and on CM designation label	DC voltmeter with measurement range according to expected power supply voltage value - for voltage polarity check. Visual check, no tool is required – for MCB check	2 minutes
Connection between CM and ISM shall be according to subchapter 4.2.5	Multimeter - for validation of correct wiring connections (utilizing the continuity function of the meter)	5 minutes
Checking that all secondary connections have been secured adequately	Visual and mechanical check of connections, no tool is required	2 minutes
Checking whether the CM, ISM are connected according to project/ product documentation and according to circuit diagrams in "Appendix 3. Secondary schemes".	Multimeter - for validation of correct wiring connections (utilizing the continuity function of the meter)	5 minutes
Connect computer to control module USB port to read actual operations counter value. Store the value together with ISM module serial number for future records.	Computer with USB type A port and Tavrida software installed, USB type A to USB type B connection cable.	3 minutes

Table 17 - List of commissioning operations and check-ups

Operation description	Required tool	Approximate timing
	Operation check	
 Turn on the CM auxiliary power supply then check the following: The "Power" LED must light up immediately; The "Ready" LED must light up continuously within 15 s after switching on; The "Malfunction" LED must not light up; The "Ready" relay contact must close within 15 s.; The "Malfunction or Loss of auxiliary supply" relay contact must change its state¹; The "ISM main contact position" relay contact must not change its state; ISM main contacts must not change their state (ISM shall remain open). 	Visual check, no tool is required	1 minute
 Apply close command to the CM then check the following: The "Power" LED must light continuously; The "Ready" LED must light continuously; The "Malfunction" LED must not light up; The "Ready" relay contact must not change its state; The "Malfunction or Loss of auxiliary supply" relay contact must not change its state; The "ISM main contact position" relay contact must change its state; ISM main contacts must change their state (ISM shall be closed). 	Visual check, no tool is required	1 minute
 Apply trip command to the CM then check the following: The "Power" LED must light continuously; The "Ready" LED must light continuously; The "Malfunction" LED must not light up; The "Ready" relay contact must not change its state; The "Malfunction of Loss of auxiliary supply" relay contact must not change its state; The "ISM main contact position" relay contact must change its state; ISM main contacts must change their state (ISM shall be open). 	Visual check, no tool is required	1 minute

1) As earlier, after CM power supply disconnection this relay indicated the CM state: "Power supply voltage is absent for more than 1.5 seconds"

Operation description	Required tool	Approximate timing
 Do not remove trip command and apply close command to the CM then check the following: The "Power" LED must light continuously; The "Ready" LED must light continuously; The "Malfunction" LED must not light up; The "Ready" relay contact must not change its state; The "Malfunction or Loss of auxiliary supply" relay contact must not change its state; The "ISM main contact position" relay contact must not change its state; ISM main contacts must not change their state (ISM shall remain open). 	Visual check, no tool is required	1 minute
 Remove close and trip commands to the CM then check the following: The "Power" LED must light continuously; The "Ready" LED must light continuously; The "Malfunction" LED must not light up; The "Ready" relay contact must not change its state; The "Malfunction or Loss of auxiliary supply" relay contact must not change its state; The "ISM main contact position" relay must not change its state; ISM main contacts must not change their state (ISM shall remain open). 	Visual check, no tool is required	1 minute
 Apply and keep close command and then apply trip command to the CM then check the following: The "Power" LED must light continuously; The "Ready" LED must go out after the trip of the ISM and then light up continuously within 10 s.; The "Malfunction" LED must not light up; The "Ready" relay contact must change its state after the trip of the ISM and then change its state again within 10 s.; The "Malfunction or Loss of auxiliary supply" relay contact must not change its state; The "ISM main contact position" relay contact must change its state; ISM main contacts must change their state each time when ISM is closed and open. 	Visual check, no tool is required	1 minute

Operation description	Required tool	Approximate timing	
Primary circuits insulation check ¹⁾			
Observe safety precautions listed in the danger and warning advisories. Construct proper barriers and warning light systems	Equipment to provide safety in the test area	10 minutes	
Ground each pole of ISM that is not under $\ensuremath{test}^{\ensuremath{2})}$	Wires	2 minutes	
Apply slowly rising $100\%^{3)}$ of test voltage ⁴⁾ (50 or 60 Hz) across each pole for one minute ⁵⁾ . (ISM is open)	Power frequency withstand voltage test set	2 minutes	
If the pole sustains the test voltage for that period, its vacuum integrity has been verifed ⁶⁾	Power frequency withstand voltage test set	-	
Repeat actions above to check each pole of ISM	Power frequency withstand voltage test set, wires	8 minutes	
Close the ISM. Ground each pole of ISM that is not under test ²⁾	Wires	1 minute	
Apply slowly rising 100% ³⁾ of test voltage ³⁾ (50 or 60 Hz) between a primary conductor of the pole and ground for one minute, repeat test for each pole of ISM	Power frequency withstand voltage test set	12 minutes	
If no disruptive discharge occurs, the insulation system is satisfactory	Power frequency withstand voltage test set	-	
After the test, ground all main circuit terminals to dissipate any static charge	Wires	2 minutes	
Auxiliary circuits insulation check			
Connect all points of the secondary circuits with a shorting wire. ISM coil connection wires must be disconnected from connector X3 of CM before the test	Wires	5 minutes	
Connect the shorting wire to the high potential lead of the high voltage tester and ground the circuit breaker housing. Starting with zero volts, gradually increase the test voltage to 1500 V RMS, 50 or 60 Hz. Maintain test voltage for one minute	Power frequency withstand voltage test set	3 minutes	
If no disruptive discharge occurs, the secondary circuits insulation level is satisfactory	Power frequency withstand voltage test set	-	
Disconnect the shorting wire and re-attach the wires to connector X3 of CM	Visual check, no tool is required	5 minutes	

This test includes not only the vacuum interrupter test, but also the other insulation components tested in parallel with the interrupter. These include 1) the standoff insulators and the insulated drive links, as well as the insulating (tension) struts between the upper and lower vacuum interrupter supports. If these insulation components are contaminated or defective, the test voltage will not be sustained. If so, clean or replace the affected components, and retest. Three phase ISM should be tested phase by phase only. Therefore poles not under the test should be grounded. For test of separate ISM - 100% level of test voltage, for test of Switchgear with installed ISM - 80% level of test voltage.

2)

3) 4)

Rated test voltage levels (Ud) are given in Table 1.

To apply test voltage single-core short cables should be used. Application of high voltage coaxial cables is strictly prohibited. To coordinate the surge impedance between the test set and ISM extra resistor as shown in the Figure 89 shall be used. 5)

6) During testing of vacuum interrupter, self-fading restrikes may appear. In case of restrikes, reduce the voltage slightly until the restrikes disappear (for 10-15 seconds) and then increase again.

Operation description	Required tool	Approximate timing
F	Primary circuits contact resistance check	
ISM shall be closed before the test, there should not be any external circuits connected to ISM main terminals that provide parallel circuit with the ISM main circuits otherwise tests will be invalid.	Visual check, no tool is required	1 minute
Test equipment shall be connected to ISM main circuits terminals according to Figure 90 in order exclude any additional contact resistance and to decrease measurement error. Main contact resistance shall be measured by appropriate equipment at test current not less than 50 A.	Resistance measurement test equipment with test current not less than 50 A	10 minutes
Measured values for ISM15_LD, ISM25_LD and ISM15_MD must not exceed limits specified in Table 1. Measured values for ISM15_Shell and ISM15_HD must not exceed limits specified in Table 1 increased on 2 μ Ohm. These 2 μ Ohm are added by contact resistance between ISM terminals and additional bars attached to them (see in the Figure 90)	Visual check, no tool is required	-

After above listed tests were performed successfully the ISM can be put into operation.

The Vacuum integrity and solid insulation test installation

Figure 90 The connection points of the contact resistance meter

6 Operation

6.1 Switching

6.1.1 Closing

To close the ISM main contacts the CM close command shall be applied. It is a "dry contact" input so no external voltage should be applied.

- The Close command will be accepted if:
- CM state is "Ready" (Ready LED flashes green);
- no Trip command is applied;
- optional electrical interlock is unlocked;
- mechanical and electrical interlock is unlocked.

If Close command is applied and held before the CM is in a "Ready" state the Close command will not be accepted. If auxiliary power is not available, the manual generator CBunit_ManGen can be used to charge the CM capacitors and to close the ISM. Mechanical closing is not possible.

- 1. Close command input
- 2. Trip command input

Figure 91 CM_16 close and trip inputs

If Manual generators CBunit_ManGen are used to charge the CM, the Manual generator handle shall be rotated until the Ready LED of the CM flashes green (approximately 30 seconds). Then the ISM close command can be applied to the CM. One possible variant is the connection of NO and Common contacts of relay Ready to the Close command input of the CM. Be aware that in this case the ISM will be closed automatically once the CM reaches the Ready state.

Figure 92 CM_16 power supply connection

If Manual generators CBunit_ManGen are used for charging the CM, DC voltage outputs of the Manual generator shall be connected to the power supply inputs (Figure 92) of CM_16_1. Pay special attention to the correct polarity for CM_16_1(60_2).

6.1.2 Opening

To open the ISM main circuits, a trip command should be applied to the CM trip command input. It is a "dry contact" input so no external voltage should be applied. The trip command will be accepted if:

- CM state is "Ready" (Ready LED flashes green) or within 60 seconds after the removal of the auxiliary power supply;
- optional electrical interlock is unlocked;
- mechanical and electrical interlock is unlocked. If the trip command is applied and kept before the CM is in a "Ready" state, the trip command will not be accepted.

6.1.3 Emergency opening

The ISM can also be opened manually. When the synchronizing shaft is rotated, a force exceeding the magnetic attraction forces of the ring magnet is applied to the armature, which subsequently starts to move. As the air gap increases, the opening springs and the contact pressure springs overcome the magnetic holding force, and the vacuum interrupter opens.

To open the ISM15_MD_1, ISM15_MD_3 manually, the torque shall be applied to the interlocking shaft evenly during its movement - see Figure 93. The torque shall be applied counterclockwise of shaft rotation (90 degrees angle). The torque shall not be applied at the end of shaft rotation. ISM15_MD_1, ISM15_MD_3, have a built in electrical interlock that interrupts the ISM coil circuit after the interlocking shaft is rotated counterclockwise. After manual trip, the shaft should be rotated clockwise to unlock the ISM.

Figure 93 ISM15_MD_1 manual trip

7 Maintenance and troubleshooting

7.1 Primary circuits

Under normal operating conditions (see Table 1) the ISM is maintenance free for a period of at least 30 years or until it has reached the permissible number of operating cycles.

However when maintenance is carried out on the switchgear then the commissioning tests should be repeated. Check that the ISM is disconnected from all voltage sources before inspecting its insulating parts. Test results should be treated as given in Table 18.

Operation description	Required tool	Approximate timing
Check for damage, remove any dirt, conta- mination or moisture	Dry napless cloth or a napless cloth soaked in alcohol to clean the insulation	5 minutes
Bolts and torques shall be according to Figure 37	Torque wrench according to torque value	2 minutes
Protective earthing shall be according to subchapter 4.1.6	Wrench if required	1 minute
	ISM operation check	
Perform close and open operation of the ISM. Modules shall be operable. Otherwise, check the control circuit. If necessary, change the failed module.	Visual check, no tool is required	1 minute
	Primary circuits insulation check ¹⁾	
Observe safety precautions listed in the danger and warning advisories. Construct the proper barrier and warning light system	Equipment to provide safety in test area	10 minutes
Ground each pole not under test	Wires	2 minutes
Apply slowly rising 100% ²⁾ of test voltage ³⁾ (50 or 60 Hz) across each pole for one minu- te ⁴⁾ . (ISM is open)	Power frequency withstand voltage test set	2 minutes
If the pole sustains the test voltage for that period, its vacuum integrity has been verifed ⁵⁾	Power frequency withstand voltage test set	-
Repeat actions above to check each pole of the ISM	Power frequency withstand voltage test set, wires	8 minutes
Close the ISM. Ground each pole not under test	Wires	1 minute
Apply slowly rising 80% of test voltage ²⁾ (50 or 60 Hz) between a primary conductor of the pole and ground for one minute, repeat test for each pole of ISM	Power frequency withstand voltage test set	12 minutes
If no disruptive discharge occurs, the insulation system is satisfactory	Power frequency withstand voltage test set	-
After the test, ground all main circuit terminals to dissipate any static charge	Wires	2 minutes

Table 18 - List of tests and check-ups of ISM during maintenance

1) This test includes not only the vacuum interrupter test, but also the other insulation components tested in parallel with the interrupter. These include the support insulators and the insulated drive links, as well as the insulating (tension) struts between the upper and lower vacuum interrupter supports. If these insulation components are contaminated or defective, the test voltage will not be sustained. If so, clean or replace the affected components, and retest.

2) For test of separate ISM - 100% of test voltage according to C37.09 - 100% level of test voltage, for test of Switchgear with installed ISM - 80% level of test voltage.

3) Rated test voltage levels (Ud) are given in Table 1 above.

4) To apply test voltage the single-core short cables should be used. Application of high voltage coaxial cables is strictly prohibited. To coordinate the surge impedance between the test set and ISM extra resistor as shown in Figure 89 shall be used.

5) During testing of vacuum interrupter, self-fading restrikes may appear. In case of restrikes, reduce the voltage slightly until the restrikes disappear (for 10-15 seconds) and then increase again.

Operation description	Required tool	Approximate timing
	Primary circuits contact resistance check	1)
ISM shall be closed before the test, there should not be any external circuits connected to ISM main terminals that provide parallel circuit with the ISM main circuits otherwise tests will be invalid.	Visual check, no tool is required	1 minute
Test equipment shall be connected to ISM main circuits terminals according to Figure 90 in order exclude any additional contact resistance and to decrease measurement error. Main contact resistance shall be measured by appropriate equipment at test current not less than 50 A.	Resistance measurement test equipment with test current not less than 50 A	10 minutes
Measured values for ISM15_LD, ISM25_LD and ISM15_MD must not exceed limits specified in Table 1 ¹⁾ Measured values for ISM15_Shell and ISM15_HD must not exceed limits specified in Table 1 increased on 2 μ Ohm. These 2 μ Ohm are added by contact resistance between ISM terminals and additional bars attached to them (see in the Figure 90)	Visual check, no tool is required	-

1) If the Module has contact resistance which exceeds the specified limit but is less than twice this limit, continuation of use is possible, if actual continuous current does not exceed the following value:

$$Ia < Ir \sqrt{\frac{Rr}{Ra}}$$

where:

la, Ra — actual current and corresponding contact resistance,

Ir, Rr — rated values (Table 1).

If the contact resistance is at least twice as high as the specified limit, the ISM must be replaced.

Additionally switchboards can be subjected to extra tests that are specified in corresponding documentation for the switchboards.

7.2 Secondary circuits

The CM is inherently maintenance free. However when maintenance is carried out on the switchgear then commissioning tests should be repeated. It is also recommended to conduct regular visual checks of the module housing and insulation of the wires connected to the CM. Test results should be treated as given in the Table 19.

Operation description	Required tool	Approximate timing
	Auxiliary circuits insulation check	
Connect all points of the secondary circuits with a shorting wire. ISM coil connection wires must be disconnected from connector X3 of the CM before the test.	Wires	5 minutes
Connect the shorting wire to the high potential lead of the high voltage tester and ground the circuit breaker housing. Start with zero volts, gradually increase the test voltage to 2000 V RMS, 50 or 60 Hz. Maintain test voltage for one minute.	Power frequency withstand voltage test set	3 minutes
If no disruptive discharge occurs, the secondary circuits insulation level is satisfactory.	Power frequency withstand voltage test set	-
Disconnect the shorting wire and reattach the wires to connector X3 of the CM.	Visual check, no tool is required	5 minutes

Table 19 - List of tests and check-ups of CM during maintenance

7.3 Troubleshooting

If during installation, commissioning, operation or maintenance any non-conformity occurs, contact your nearest Tavrida Electric sales representative. The contact data and web site links are listed at the end of this document. In case of a non-conformity any repairs are strictly prohibited without permission from the sales representative. To be sure that a non-conformity occurred, please perform the checks as mentioned in Table 20 prior to contacting our regional representative.

Failure description	Possible reason	Method of elimination
Appearance failure	Mechanical or arc damage, breach of service conditions	Replacement of failed component
Excessive contact resistance of ISM	ISM reached the permissible number of operating cycles or decreasing of insulation level in ISM vacuum interrupters	Replacement of ISM
ISM cannot pass power frequency voltage withstand test at 80 % of rated voltage	ISM vacuum interrupters or insulation damage	Replacement of ISM
	ISM is interlocked	Check ISM interlock state and its actuator coil connection with connector X3 of CM
ISM cannot perform close/trip operation	CM failure	Check CM LED states
	Mechanical damage of ISM	Replacement of ISM
1 blink of CM "Malfunction" LED	Absence of CM power supply	Check presence of CM power supply, its polarity and voltage level
2 blinks of CM "Malfunction" LED	ISM cannot be closed / tripped	Check the circuit of ISM actuator coil connection with connector X3 of CM, check state of ISM electrical interlocks
3 blinks of CM "Malfunction" LED	ISM actuator coil circuit is interrupted	Check the circuit of ISM actuator coil connection with connector X3 of CM, check state of ISM electrical interlocks
4 blinks of CM "Malfunction" LED	Short circuit of ISM actuator coil circuit	Check the circuit of ISM actuator coil connection with connector X3 of CM, check state of ISM electrical interlocks
5 blinks of CM "Malfunction" LED	Manual trip of ISM and ISM is electrically interlocked	Check the ISM and its interlock state
6 blinks of CM "Malfunction" LED	CM is out of the temperature range	Stop performing CO operations until the blinks stop if temperature is above the temperature range or move CM into environment with higher temperature if temperature is below the temperature range.
7 blinks of CM "Malfunction" LED	ISM state is open without command from the CM	Check the ISM and its interlock state
CM "Malfunction" LED lights continuously	Internal fault of CM	Replacement of CM
None of CM LEDs lights	Absence of CM power supply	Check presence of CM power supply, its polarity and voltage level
	Internal fault of CM	Replacement of CM

Table 20 - Typical fault symptoms and methods of their elimination

The ISM or CM removal and the installation of the new one should be performed according to chapter 0. The checks and tests after substitution are described in chapter 5.

8 Disposal

All Tavrida Electric Vacuum Circuit Breakers and their components are manufactured from environmentally friendly materials, therefore no special waste disposal is required.

Notes:

Ð

The CM_16 series control modules have three latching output relays in an SPDT configuration. Each relay can be factory programmed for one of three functions per the chart below. See the settings code label on the right side of the CM_16 module for as-shipped relay configuration.

The relays will change state from unasserted to asserted based on the firmware logic as outlined in the chart below. Note that as the relays are latching types they will retain their last state (asserted or unasserted) after power loss and complete discharge of the module capacitor bank.

Relay programmed Function		Relay reacti	on to Control / E	Breaker Events		
Retay programmed runchon	Breaker Open	Breaker Closed	Malfunction	Trip on Loss of Supply	Loss of Supply	Ready to Close
Breaker Position Indication	Unasserted	Asserted	NO EFFECT	Unasserted	NO EFFECT	NO EFFECT
(Indication whether breaker is open or closed)						
Ready	NO EFFECT	NO EFFECT	Unasserted	NO EFFECT	Asserted	Asserted
(Indication that the control module is ready to perform close operation)						
Mar Revenue Marca	NO FEFE	NO FFFFF		NO FFFFF		
Malfunction	NO EFFECT	NO EFFECT	Asserted	NO EFFECT	Unasserted	Unasserted
(Indication that there is an error; all close operations blocked until corrected)						
UV Active	NO EFFECT	NO EFFECT	NO EFFECT	Asserted	NO EFFECT	NO EFFECT
(Indication that trip on loss of supply occurred. Available if UV is set "on")						
Loss of Supply	NO EFFECT	NO EFFECT	NO EFFECT	Asserted×	Asserted	Unasserted
